

## Squirrel Produce Ultrasonic Noise!!

I am going to tell you the science news update about the squirrel in the title, "Squirrels Emit Ultrasonic Noise, Warn Others of Danger" "Ground squirrels living in the Northern plains of North American have been found to emit screams in the ultrasonic range to warn others of their kind of oncoming danger. Until now, it was not known that any mammal used ultrasound as an alarm. Researchers have also found that while nearby squirrels can hear the high frequency calls, predators such as hawks cannot. The original discovery occurred in 1993 when Dr. Hare was out in the field making recordings of the audible calls of the squirrels. He was using a model of a predator, in the form of a beige colored hat, tossed into the air to startle the animals and trigger them to make alarm calls." This is very weird that mammals can produce ultrasonic noise. I think it is a very good discovers and I am happy that there are many things new everyday in our world.
