

## Should students who are under-achieving repeat the year?

In some countries pupils are tested to find out if they are achieving or under-achieving. Pupils who are under-achieving are made to retake the academic year until they attain the pass rate.

I think that students who are under-achieving should repeat the year as then only the students will understand and know the importance of studying. Brighter students can progress more quickly. It is argued that a higher level of education is maintained if all students have to achieve the same pass rate. It could encourage some pupils to study harder if they think they will fail. Like for example, brighter students work hard to get good grades and the under-achieving students don't do any work in the class or listen to the teacher while he/she is teaching, but still they go to next class by doing nothing which can also let brighter students do nothing at all and due to which no one gain knowledge. But, if the under-achieving will repeat the year, they will understand the importance of studying and will also work so that they get good grades and go to the next class.

I think children who are under-achieving should repeat the year because they are not smart enough for the year. For example, there is a class full of smart people and one underachieving student, the one who is underachieving would waste the time of the smart ones educations by asking the teachers stupid questions and mostly the underachieving people are bad and naughty so they will also disturb the others learning.
